No. 7

The screenshot shows a Python IDE with a file named 'modul 6.py'. The code implements a merge sort algorithm. It starts with a comment '#Nomor 7' and imports 'time' as 'detak' and 'random' with 'shuffle' as 'kocok'. It generates a list 'k' of 6001 random integers. The 'mergeSort' function recursively splits the array into halves and merges them back in sorted order. The 'partition' function is also defined. The execution results in the Python 3.8.2 Shell show the execution time for 'merge' (0.0651388 detik), 'quick' (0.035008 detik), and 'merge mod' (-0.00500178 detik), with 'quick mod' (-0.111008 detik) also shown.

```
#Nomor 7
from time import time as detak
from random import shuffle as kocok
import time
